

# Research data management and the FAIR Data Pilot

*RCSI Open Science week, 23 Oct 2019*

**Annalisa Montesanti, PhD**

**Programme Manager - Health Research Careers**

**Research. Evidence. Action.**

# I will discuss

- The ambition - Why
- Facilitating the transition to open and FAIR data – a step-wise approach
- (HRB) FAIR DMP Pilot – building awareness and expertise
- An international collaborative effort: The Funder Implementation Study

# The ambition

Ensuring that its funded research can have the **greatest possible impact** by having more

- Openness and transparency
- Reproducibility and replicability
- Acceleration of knowledge discovery and its application
- Discoverability and accessibility
- Interoperability across different domains and disciplines
- (Re)Usability

# Towards a more open research environment

Many funders and other stakeholders have now embraced

- Open science
- DORA San Francisco Declaration for researchers assessment
- Open access (moving to Plan S)
- Open data and data sharing
- Data management and stewardship as intrinsic to good research practice
- FAIR principles - BUT what do they really mean in practice?

How to align and implement them in practice?

# Research data

- Research data are an important and expensive output of the scholarly research process, across all disciplines.
- They are an essential part of the resources necessary to evaluate research results, and to reconstruct the events and processes leading to them.
- Their value increases when they are aggregated into collections and become more available for re-use to establish reproducibility and to address new and challenging research questions.
- There is a growing international consensus on the need to comply with good practice in the use and reuse of research data with the ultimate goal of preserve and share research data in a manner that maximises their long-term value.
- Without proper data stewardship, the value of data risks to be greatly diminished and underutilised;
  - Poor data management is perhaps the single largest source of research waste:
  - Data are often lost or discarded or not properly managed at the end of the study;

<https://www.youtube.com/watch?v=N2zK3sAtr-4>

# Increasing the value of research data: DM&S

There is now more emphasis on good data management and stewardship before starting a research project.

- A data management plan (DMP) is a formal document describing how research data will be managed and documented throughout a research project and the terms regarding the subsequent deposit of the data with a data repository for long-term management and preservation.
- It is supposed to be a living document which update during the project.
- Data management is an ongoing process and planning in the early stages makes the whole endeavour easier.
- Good research data management & stewardship is not a goal in itself, but rather the key conduit leading to knowledge discovery and innovation, and to subsequent data and knowledge integration and reuse.

# What is FAIR

Data and services that are

- findable,
- accessible,
- interoperable,
- re-usable

both for machines and for people.”

# What is FAIR

DTL | 

## WHAT IS FAIR DATA?

FAIR Data aims to support existing communities in their attempts to enable valuable scientific data and knowledge to be published and utilised in a 'FAIR' manner.

**F**indable - (meta)data is uniquely and persistently identifiable. Should have basic machine readable descriptive metadata.

**A**ccessible - data is reachable and accessible by humans and machines using standard formats and protocols.

**I**nteroperable - (meta)data is machine readable and annotated with resolvable vocabularies/ontologies.

**R**eusable - (meta)data is sufficiently well-described to allow (semi)automated integration with other compatible data sources.

# Findable

F1: (meta) data

**unique** and

F2: Data are d

**metadata**

F3: Metadata c

include the i  
describes

F4: (meta) data

**indexed** in a

# Interoperable

I1: (meta) data

accessible,  
applicable to

**knowledge**

I2: (meta) data

follow the F

I3: (meta) data

**references**

## How FAIR are your data?

### Findable

It should be possible for others to discover your data. Rich metadata should be available online in a searchable resource, and the data should be assigned a persistent identifier.

- A persistent identifier is assigned to your data
- There are rich metadata, describing your data
- The metadata are online in a searchable resource e.g. a catalogue or data repository
- The metadata record specifies the persistent identifier

### Accessible

It should be possible for humans and machines to gain access to your data, under specific conditions or restrictions where appropriate. FAIR does not mean that data need to be open! There should be metadata, even if the data aren't accessible.

- Following the persistent ID will take you to the data or associated metadata
- The protocol by which data can be retrieved follows recognised standards e.g. http
- The access procedure includes authentication and authorisation steps, if necessary
- Metadata are accessible, wherever possible, even if the data aren't

### Interoperable

Data and metadata should conform to recognised formats and standards to allow them to be combined and exchanged.

- Data is provided in commonly understood and preferably open formats
- The metadata provided follows relevant standards
- Controlled vocabularies, keywords, thesauri or ontologies are used where possible
- Qualified references and links are provided to other related data

### Reusable

Lots of documentation is needed to support data interpretation and reuse. The data should conform to community norms and be clearly licensed so others know what kinds of reuse are permitted.

- The data are accurate and well described with many relevant attributes
- The data have a clear and accessible data usage license
- It is clear how, why and by whom the data have been created and processed
- The data and metadata meet relevant domain standards

# FAIR vs Open: a misconception

## FAIR does not mean open:

- Open data should be available to everyone to access, use, and share, without licences, copyright, or patents. It is expected that open data at most should be subject to attribution/share-alike licenses.

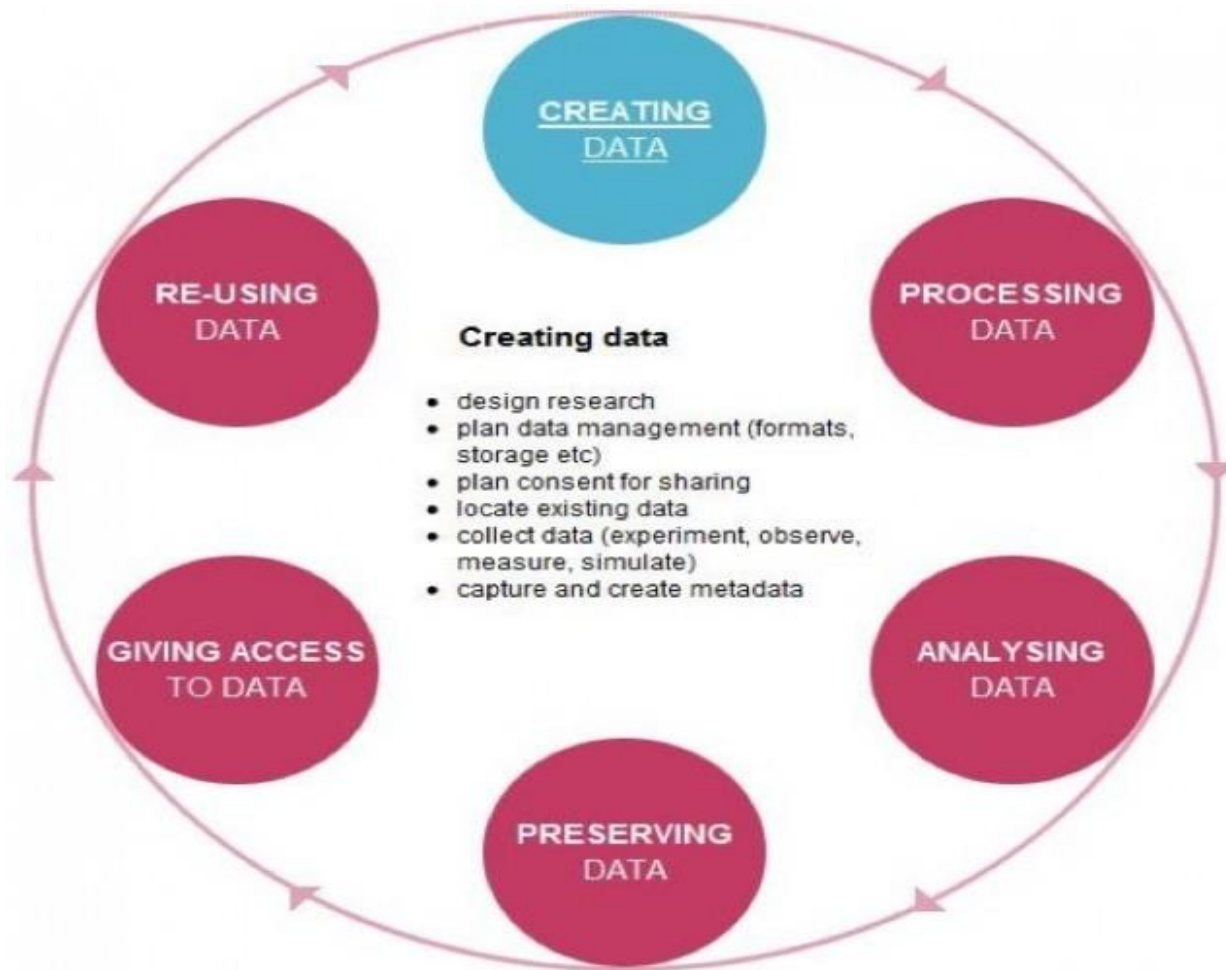

FAIR data uses “**Findable**” where data should be able to be found by appropriate people at appropriate times. This can include shared folders, drives, private databases, public databases or more. It really depends on what part of the data life cycle the data is currently in.

FAIR data uses “**Accessible**” to mean accessible by appropriate people, at an appropriate time, in an appropriate way.

- Data can be FAIR when it is private, when it is accessible by a defined group of people, or when it is accessible by everyone (open data).

FAIR data uses “**Interoperable**” to refer more to how the data is formatted (e.g. standard formatting), whether the software for interpreting/interrogating/using the data is available (e.g. freely, with a license etc.)

# HRB FAIR DMP pilot

13 Data stewards upskilled and engaged in FAIR and DMP

## Main stakeholders

- GFISFO office
- Researchers
- Data stewards
- VP/Deans research
- Research offices
- Irish funders
- NORF
- Other funders
- Science Europe
- DCC

HRB constant support to Data Stewards and facilitating discussions and integration into the system

## Phase I Grant Applications

Before submitting a grant application,  
Lead Applicants liaise with data stewards  
in Host Institution

They complete the  
(1) *Outline for Data stewardship*  
and  
(2) *FAIR Data Management costs*

Peer-Review  
and panel  
review stage

Application unsuccessful

**31 Applications successful eligible for  
pilot**

Award offered and  
Contract negotiated

Awards start at different time ( Sept  
2019- April 2020

## Outline on FAIR Data Management and Stewardship (500 words limit).

- Data description and collection or reuse of existing data
- Documentation and data quality
- Storage and backup
- Ethical and legal compliance, codes of conduct
- Data sharing and long-term preservation
- Data management responsibilities and resources

# Eligible costs in funding budget

6. FAIR Data Management Costs	<u>Applicable to LA from institutions participating to the HRB Pilot only:</u> Costs related to data management, FAIRification, storage and archiving of research data in line with best practice of data management and stewardship and the FAIR principles incurred during the lifetime of the project should be included..
-------------------------------	---

People	Staff time per hour for data collection, data anonymisation, staff time per hour for data management/stewardship support, training, etc
Storage and computation	cloud storage, domain hosting charge
Data access	secondary data access, costs for preparing data for sharing (eg anonymisation)
Deposition and reuse	costs for depositing research data and metadata in an open access data repository e.g. defining semantic models, making data linkable, choosing the licence, defining metadata for dataset, deploying/publishing
Others	Please further explain
Notes	The HRB is currently not covering the cost of long term preservation of data This list is not exhaustive and aims to provide examples only of eligible costs

**Phase II**  
DMPs completion

**31 Awards**

Tools:  
E. g. DMPonline  
(science Europe),  
DS wizard,

Lead Applicant is working  
closely with data stewards  
at HI and prepare full DMP

**31 DMPs+ declarations submitted to HRB**

HRB initial review of DMP

International  
panel to review  
a sample of  
DMPs

Data stewards  
Provide feedback  
to HRB and Panel  
on  
process, tools,  
challenges and  
facilitators

Panel  
feedback  
provided to  
HRB

Report disseminated

Reflections and  
revisions

HRB data policy  
And implementation refined

# Collaboration with Digital Curation Centre on DMPs

- HRB currently using DMP online to host DMP template for researchers
- In discussion with other Irish research funders about creating a national platform for DMP

# Outcomes – Increased.....

# To summarise

- Research data are an important and expensive output of the scholarly research process, across all disciplines.
- Everybody has a role in ensuring that research can have the **greatest possible impact**
- Data management is an ongoing process and planning in the early stages makes the whole endeavour easier.
- Good research data management & stewardship is not a goal in itself, but rather the key conduit leading to knowledge discovery and innovation, and to subsequent data and knowledge integration and reuse.

Thank you for listening
